

Stocked cast parts for steam locomotives and historic vehicles

DB Fahrzeuginstandhaltung

Comprehensive service

Diverse solutions

Superior performance

As one of the most high-performing full service providers for rail vehicles in Europe, DB Fahrzeug-instandhaltung has the required size, the necessary experience and the modern technology that allow us to provide you with optimum maintenance of your rolling stock. This also applies to steam locomotives and historic vehicles.

Axleboxes and connecting-rod bearings

The steam-engine depot Meiningen maintained its key competency, the ability to process, uphold, repair and manufacture Axleboxes and connecting-rod bearings of historic rail vehicles since the opening of Werra Railway in 1863.

Our experts maintain, repair and manufacture plain bearings of both standard and narrow-gauge vehicles. Our range of services includes the manufacture and repair of plain bearings, from the box housing to the bottom box, the re-lining of bearings including dimensional adjustments as well as the scraping of white-metal-lined bearing surfaces in accordance with the customer specifications. We also repair and refurbish red-brass lining of bearings.

Lining of all types of bearings

In our bearing foundry we can remove and re-apply white-metal lining to almost all types of bearings. Depending on the applicable guideline or customer specifications, white metal (WM10 or WM80) is used for lining. If a bearing lining is no longer dimensionally accurate, we can correct this by applying a layer of red brass and subsequently machining the surface. Of course, we will also replace or repair any missing or defective part of a bearing lubrication system.
